

POWERED BY SIFI NETWORKS

IMPORTANT INFORMATION

Public Right of Way Construction

In most cases we will conduct work in the public right of way's parkway in front of properties. Using a dirt trench machine, a temporary trench will be created between the curb/edge of the pavement and edge of the public right of way. Crews will bore under the driveways to enable installation of the fiber conduit. The trench will be restored using soil and by dispersing grass seed and laying straw matting on top. Once restoration has been completed, residents are encouraged to water the area covered by the straw matting. The straw matting can be removed once the grass has grown to about 3-4 inches, which could take approximately 14 to 30 days or even up to 60 days. For a short period of time the grass may also appear different from other grass in the area.

We are confident residents will realize the long-term benefits of this privately funded, superfast fiber network in their community for generations to come.
